

# The CRITEX project:

Challenging equipments for the temporal and spatial exploration of the **Critical Zone** at the catchment scale

PI : Jérôme Gaillardet (IPG Paris)

Co-PI : Laurent Longuevergne (Géosciences Rennes)

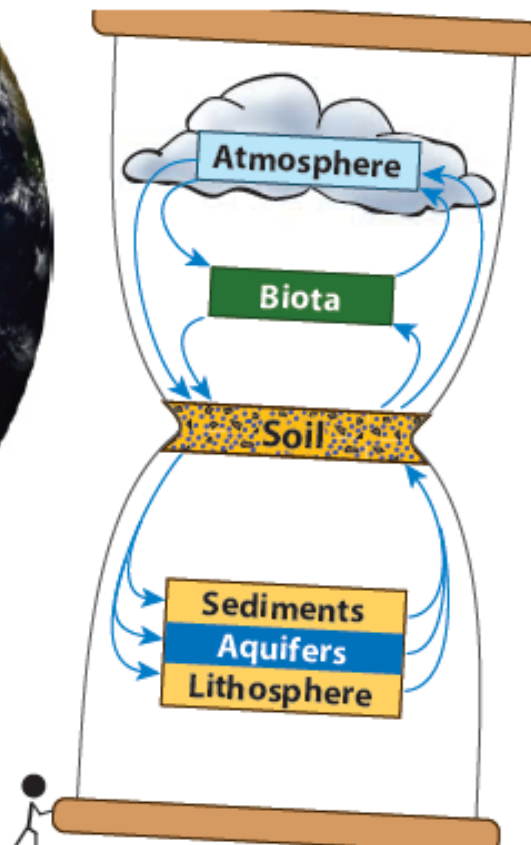

# The critical zone : between Sky and Rocks

# The critical zone : between Sky and Rocks

Under human and  
climatic pressure

## Overarching questions

Water, matter and energy budget at catchment scale, reactivity dynamics, impact of heterogeneity ...

## Ambition of CRITEX

Bridge the gap among scientific communities working on the Critical Zone, share techniques on given sites.

# CRITEX : a common shared infrastructure

- Sharing instruments and knowledge : Shared instruments maintained by “reference” teams and applied on field sites of interest

- Two communities :
  - RBV – Network of hydrological observatories
  - H+ - Network of Hydrogeological research sites
- 21 partners, 15 Universities, 5 institutions
- Started Sept. 1, 2012.

- Agro-hydrological catchments
- Hydro-biogeochemical catchments
- Hydro-meteorological-erosion
- Karstic catchments

Agro-hydrological  
Hydro-biogeochemical  
Hydro-meteorological  
Karstic

Observatories

Institut national des  
sciences de l'Univers

PI : Philippe Davy  
Co-PI : Tanguy Le Borgne

# CRITEX : a shared research infrastructure

- Instruments “state of the practice”, state of the research, state of the science”.
- State of the research : prototypes of news sensors
- Mature instruments will be made available for the H+ and RBV communities and will be applied on selected field sites of interest to answer scientific question.  
Training will be organized to stimulate mutual interest between sites and techniques.

# CRITEX : Two main scientific objectives

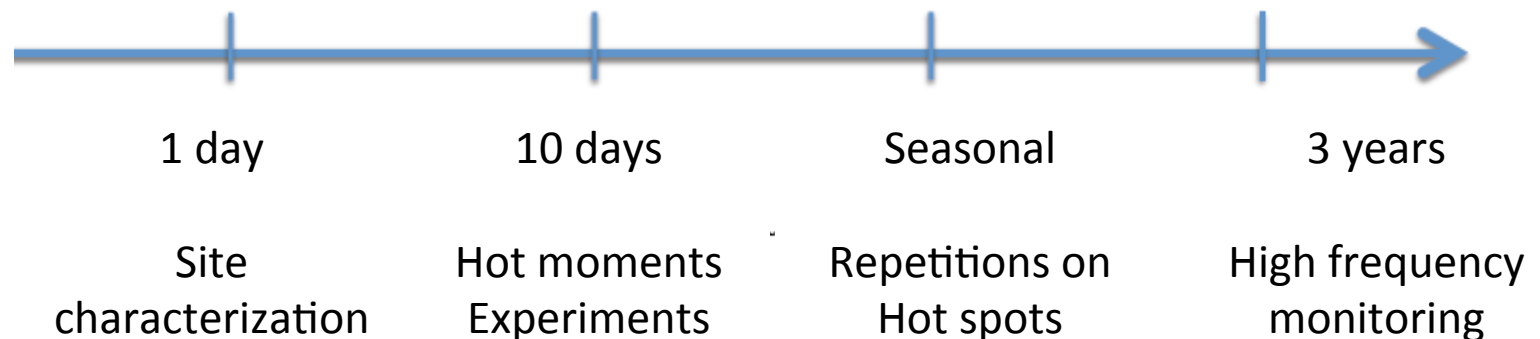

- High frequency measurements in catchments
- Monitoring campaigns to capture “hot moments” and “hot spots” of the saturated and non-saturated zone of the CZ in catchments from the field observatories.  
Include experiments and characterization

# CRITEX : organizing monitoring and experiments

## ➤ Observation strategies :

- High frequency over 2-3 years : capturing matter and energy budget
- Repeated measurements campaigns during « hot moments » on « hot spots » + Experiments

## High frequency measurements

### WP1 : soil-atmosphere exchanges

- 1.1 : microwave scintillometry
- 1.2 : flux tower ad IR scintillometry

### WP2 : pulsation of water in the ZC

- 2.1 : hydrogravimetry
- 2.2 : hydrogeodesy
- 2.3 : water sensors

### WP3 : temperature monitoring

Fiber optic for temperature and gas

### WP4 : High temporal monitoring

- 4.1 : extreme event monitoring
- 4.2 : the chemical house
- 4.3 : innovative chemical sensors

## Sequential monitoring

### WP5 : Scanning the surface

image drone exploration

### WP6 : geophysical tools of exploration

- 6.1 : seismic methods
- 6.2 : MSR
- 6.3 : electrical methods
- 6.4 : polarization
- 6.5 : CS-AMT

### WP7 : inaccessible groundwaters

- 7.1 : well equipment
- 7.2 : well monitoring
- 7.3 : reactive and inert tracer test experiments

### WP8 : chemical and isotopic fingerprints

- 8.1 : gas tracing
- 8.2 : water isotopes
- 8.3 : integrative sensors

## Task 2.2 – Hydrogeodesy, the pathways of water

### Main idea:

Subsurface permeable structures concentrate water flow and pressure changes, i.e. induce specific surface poroelastic deformation

### Observation tools to develop :

- Tiltmeters
- Vertical deformation

Task leader : Laurent Longuevergne, géosciences Rennes.

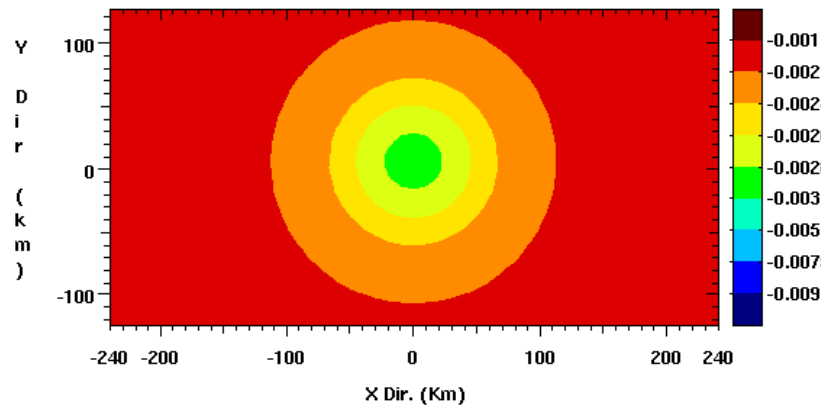

## Task 2.2 – Hydrogeodesy, the pathways of water

Modeling example:  
Surface deformation induced by pumping

Permeability field

Homogeneous media

Heterogeneous media

Heterogeneity is an opportunity as it amplifies surface deformation and creates specific surface patterns

## Task 2.2 – Hydrogeodesy, the pathways of water

### Case of Ploemur observatory

High yield pumping station in crystalline context

Ground surface elevation changes (mm)

Surface deformation highlights active parts of the main permeable fractures.

Estimation of storativity  $3 \cdot 10^{-4}$

## Task 4.2: The River Chemical House: RICH

### Real time monitoring of river quality

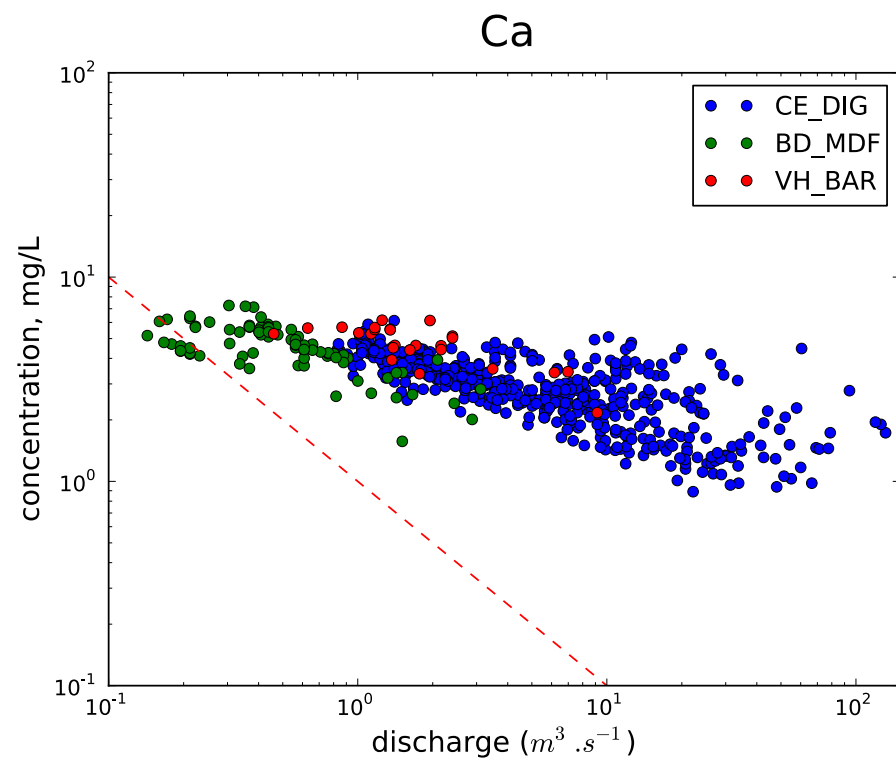

- Setting up a “house” for the real time & high---frequency monitoring of stream water chemistry with multiparametric sensors (major elements, silica, DOC, alkalinity probe under development).
- Endress-Hauser and Thermofisher companies.
- 4 analyses par hour

Task leader : Jérôme Gaillardet, Gaëlle Tallec, Jean Louis Roubaty, IPGP, IRSTEA Antony.

# Chemostatic behavior of streams

## Task 4.2 : Fiber optic monitoring of heat tracer tests to characterize preferential flow in fractured media

GEOPHYSICAL RESEARCH LETTERS, VOL. 40, 1–5, doi:10.1002/grl.50397, 2013

### Characterizing groundwater flow and heat transport in fractured rock using fiber-optic distributed temperature sensing

T. Read,<sup>1</sup> O. Bour,<sup>2</sup> V. Bense,<sup>1</sup> T. Le Borgne,<sup>2</sup> P. Goderniaux,<sup>2,3</sup> M.V. Klepikova,<sup>2</sup>  
R. Hochreutener,<sup>2</sup> N. Lavenant,<sup>2</sup> and V. Boschero<sup>2</sup>

Received 11 February 2013; revised 19 March 2013; accepted 20 March 2013.

Task leader : T. Le Borgne, géosciences Rennes.

## Task. 7.3: Reactive tracer tests for in situ assessment of reaction rates in the critical zone

Controlled injection system

Tracer experiments on the Ploemur observatory

Mixing induced microbiological activity ?

## Task. 7.3: Reactive tracer tests for in situ assessment of reaction rates in the critical zone

Mobile laboratory equipped for monitoring chemical species and microbiological properties in continuous fluxes during tracer experiments

CRITEX Mobile chemical laboratory

Task leader : T. Le Borgne, géosciences Rennes.

## Task. 8.1: Continuous measurement of dissolved gases

Task leader : Luc Aquilina, géosciences Rennes.

Acquisition of Radon analyzer, Membrane Inlet mass spectrometer (MIMs) and field  $\mu$ Gas-Chromatograph ( $\mu$ GC) for continuous dissolved gases characterization

$\mu$ GC for dissolved gas measurements

MIMs for dissolved Gas characterization  
(1 measure/5s!!)

## Task. 8.1: Continuous measurement of dissolved gases

First measurements of dissolved gases during tracer tests in Ploemeur observatory (June 2014)

1 measurement every 5 min

# Conclusions

A set of innovative instruments or of mature instruments used in a synergic innovative manner.

An opportunity to bridge the gap between communities of scientists studying the Critical Zone of the Earth

We need to develop new sensors of the Critical zone : this is becoming really urgent

The HF is not a EU Water Framework Directive requirement but will be soon

CRITEX is not the property of RBV and H+ network, it is open to the worldwide community and we hope it will foster international cooperation
